PITCH

What if the monsters you're fighting... are your neighbors?

Catharsis is a 2D roguelite card game where you play as a little black cat trying to save his village, one cursed neighbor at a time.

Every night they transform. Every run you adapt. Explore their homes, build your deck, and uncover the dark secret behind the curse, without ever hurting your new friends you're trying to protect. Fight smart. Heal them. Bring them back.

REFLECTION

Paulina Cortez Balvanera

I think that working on this project has been quite a valuable learning experience throughout my whole time studying, this because i think that I got to learn a lot about what is to work on creating, designing and developng a complete videogame and work throughout the different stages. Personally, I think that the experience allowed me to understand what makes this a functional and enjoyable experience to obtain good results. Some of my most valuable lessons include the importance of organization and plannig a game, and how it does not only dependo n coding but also in designing a lot of stuff as well as docuemting, coordinating and structiuring different works. But from a more technical experience, I am really grateful to learn about concepts and languages i was not as familiar with – working with javascript, html, css, and databases were good for different practices and I think that everything that was seen in class was really helpful for the final result.

I think this project didn't only help me as a student in the technical terms of organization and problema solving skills but also as a person and individual in the sense of collabortion and communication abilities for a shared goal.

I am grateful for the opportunity to participate in this project. Catharsis not only helped me develop technical knowledge but also gave me valuable experience that I will carry into future academic, professional, and personal works

REFLECTION

Maria Espinola Forcén

Developing this web game was a great learning experience. I used a database, an API, and JavaScript structures to create an interactive application.

Through this project, I learned how data can be stored, retrieved, and displayed dynamically on a web page. JavaScript helped me implement the game logic using functions, loops, conditions, and objects. I also improved my understanding of how APIs connect the front-end and back-end of an application, although I faced some challenges while debugging and managing data, solving these issues helped me strengthen my programming and problem solving skills.

Overall, this project gave me valuable experience in web development and showed me how different technologies work together to create a complete application.

REFLECTION

Ilan Hanenberg Wasserman

This project taught me many valuable skills beyond the game development itself. One of the most important things I learned was how to work collaboratively using GitHub. Before this project, I had only a limited understanding of version control, but throughout the development process I learned how to manage branches, review changes, create issues and coordinate my work with other team members in a more organized and efficient way.

I also gained experience with new programming methods and practices that I had not used before. Building a game required me to think differently about how systems interact, how features should be structured, and how to organize code so that it remains maintainable as the project grows. This helped me become a more flexible and effective programmer.

Finally, this project significantly improved my understanding of SQL and database design, which have always been some of the topics I find the most challenging. Designing the database, defining relationships between entities and connecting the game data with the website helped me better understand how databases work in the real world application. As a result, I now feel more comfortable working with SQL and database concepts than I did before starting this project.

THANK
YOU
